

# Technological challenges of Augmented Reality

W. Pasman

# Overview

UbiCom: Mobile AR.

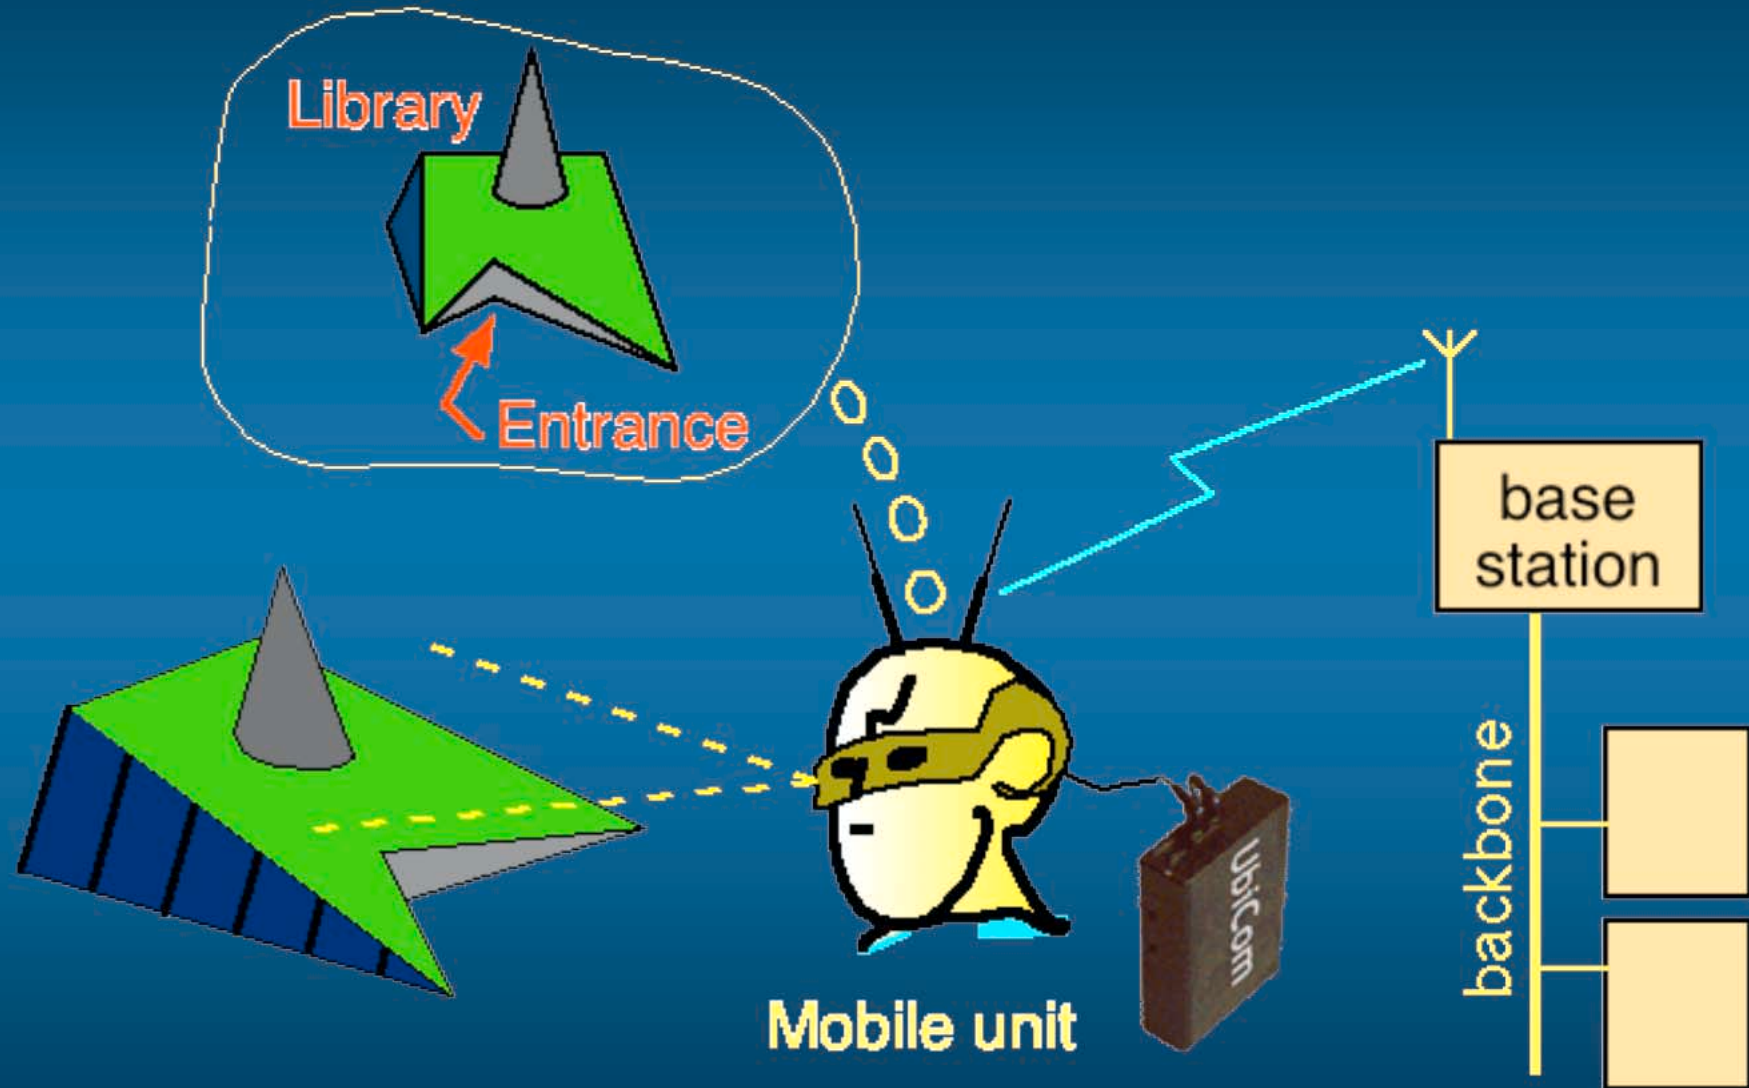

Video: Overview of UbiCom problems and solutions

UbiCom rendering QoS management

Video: Statue on Campus illustrating LL rendering

NISHE: mobile AR on PDA

# UbiCom mobile AR

# Applications

Delft University Library  
Architect: Mecanoo  
980,000 Books

Prof. Jansen

Augmented Reality  
Virtual Reality

# Maintenance, assistance

# Video: UbiCom AR

# Dynamic Simplification

Dynamic LoD generation in backbone

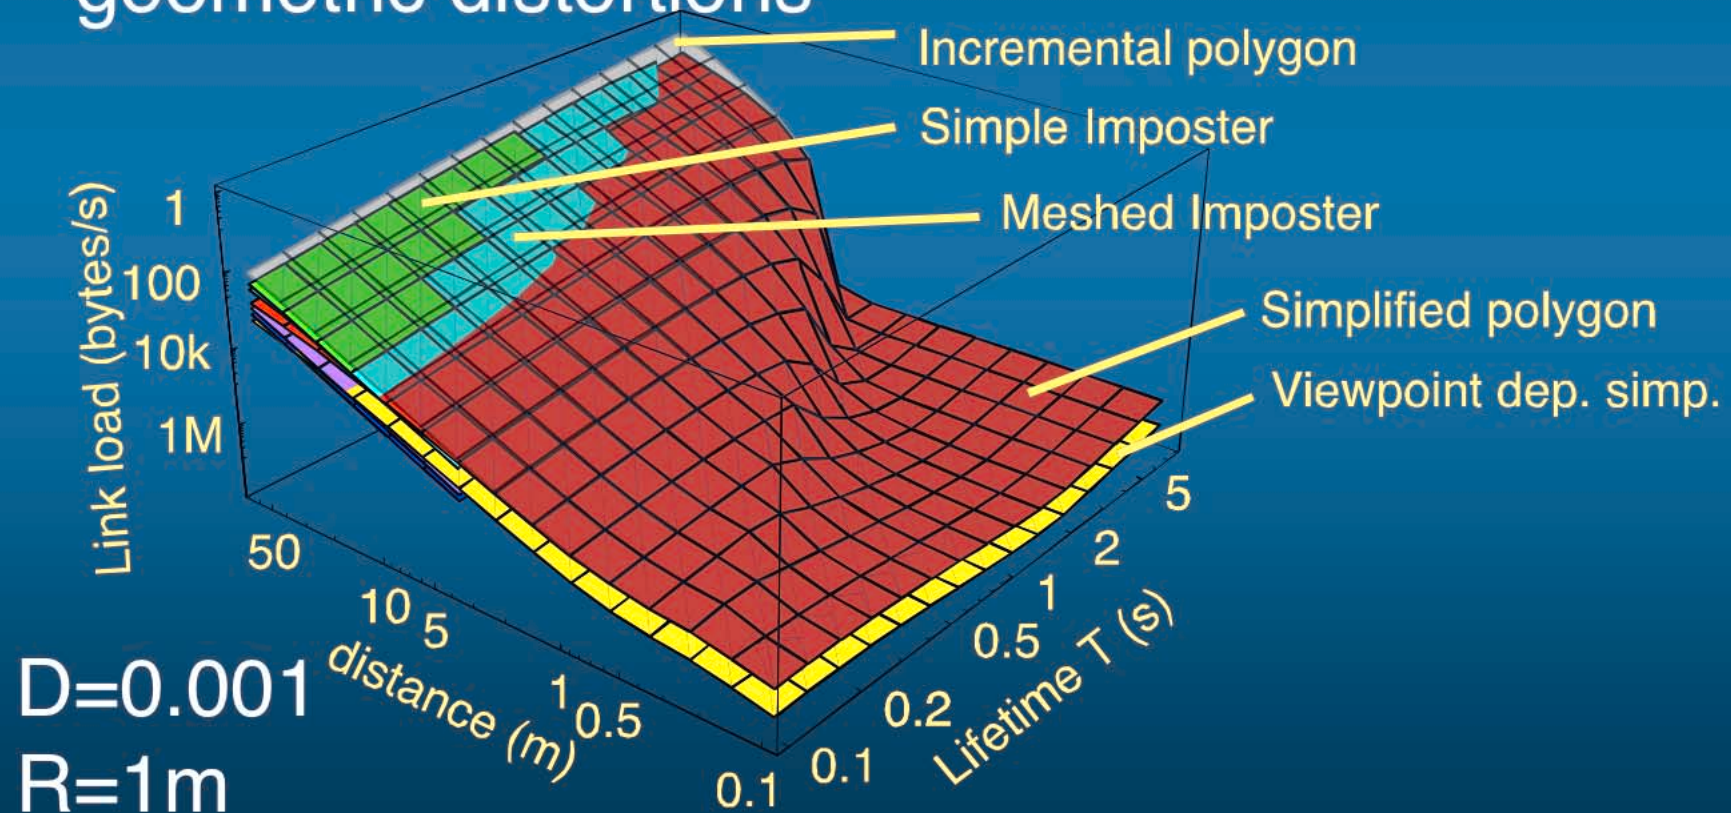

Maximize perf/cost ratio in headset.

# Mathematical model per object

- Estimate link and CPU load, memory usage, lifetime of objects, etc
- Est screenspace error and geometric distortions

# Scene Graph

# QoS: Scheduling of resources

Usual Goal: maximize benefit within a cost budget.

this problem is NP complete..

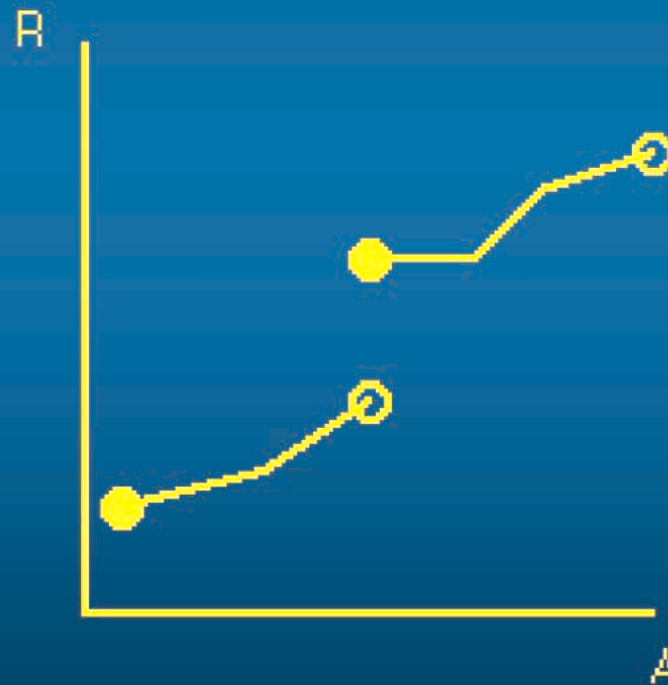

- Iterative approx giving in worst case half  
the maximum possible quality
- Quality only known after iteration
- Only feedback loop with application possible

# Accuracy Curves

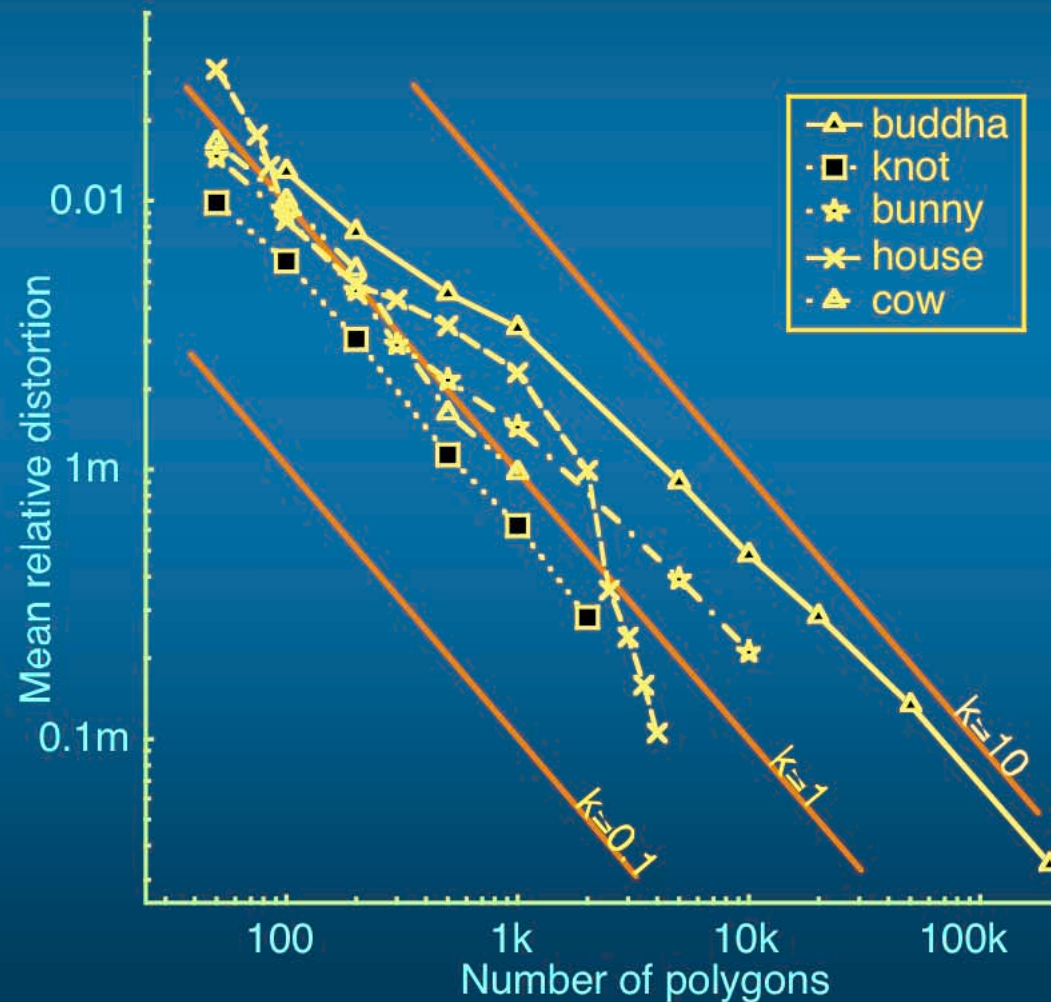

each node in scene graph is assigned an accuracy curve

- required resources as function of accuracy target
- monotonically increasing.

$R \rightarrow \# \text{polygons}$

# Measurement of geometric distortion $d$ as function of number of polygons $n$

$$d \sim C/n.$$

$$\text{Accuracy } a = 1/d$$

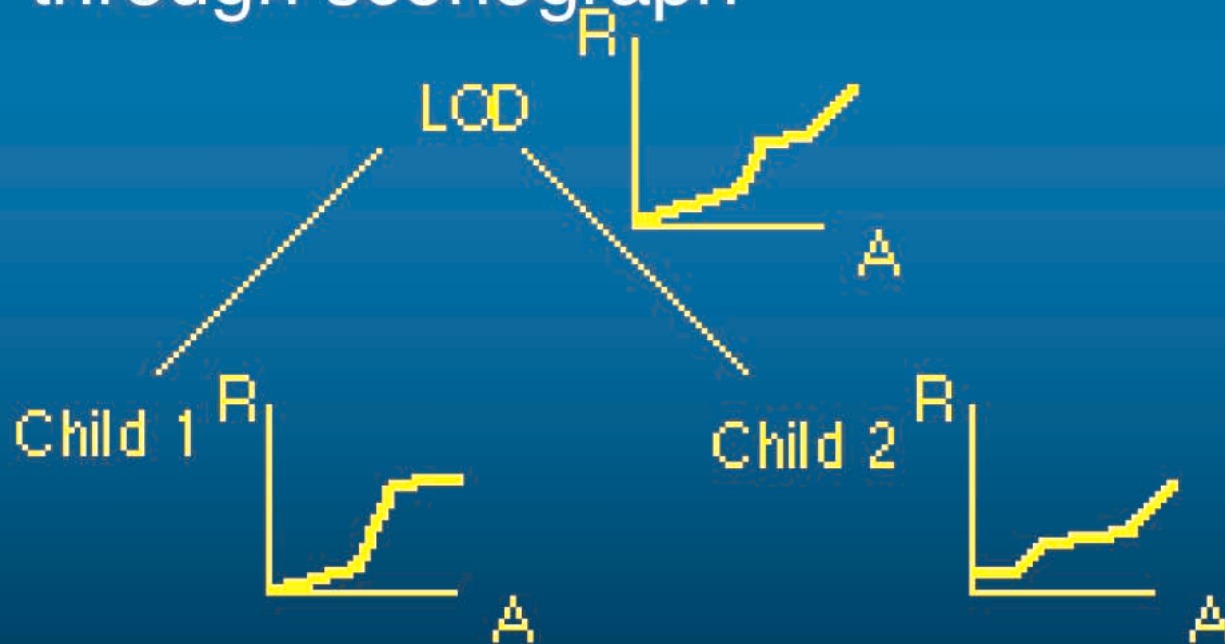

$$\text{Resource usage } r = K a + R_0$$

-> piecewise linear function

# Propagating accuracy curves

Leaf nodes: accuracy curve from (1) mathematical model or (2) measurements

Other nodes: propagate curve upwards through scenegraph

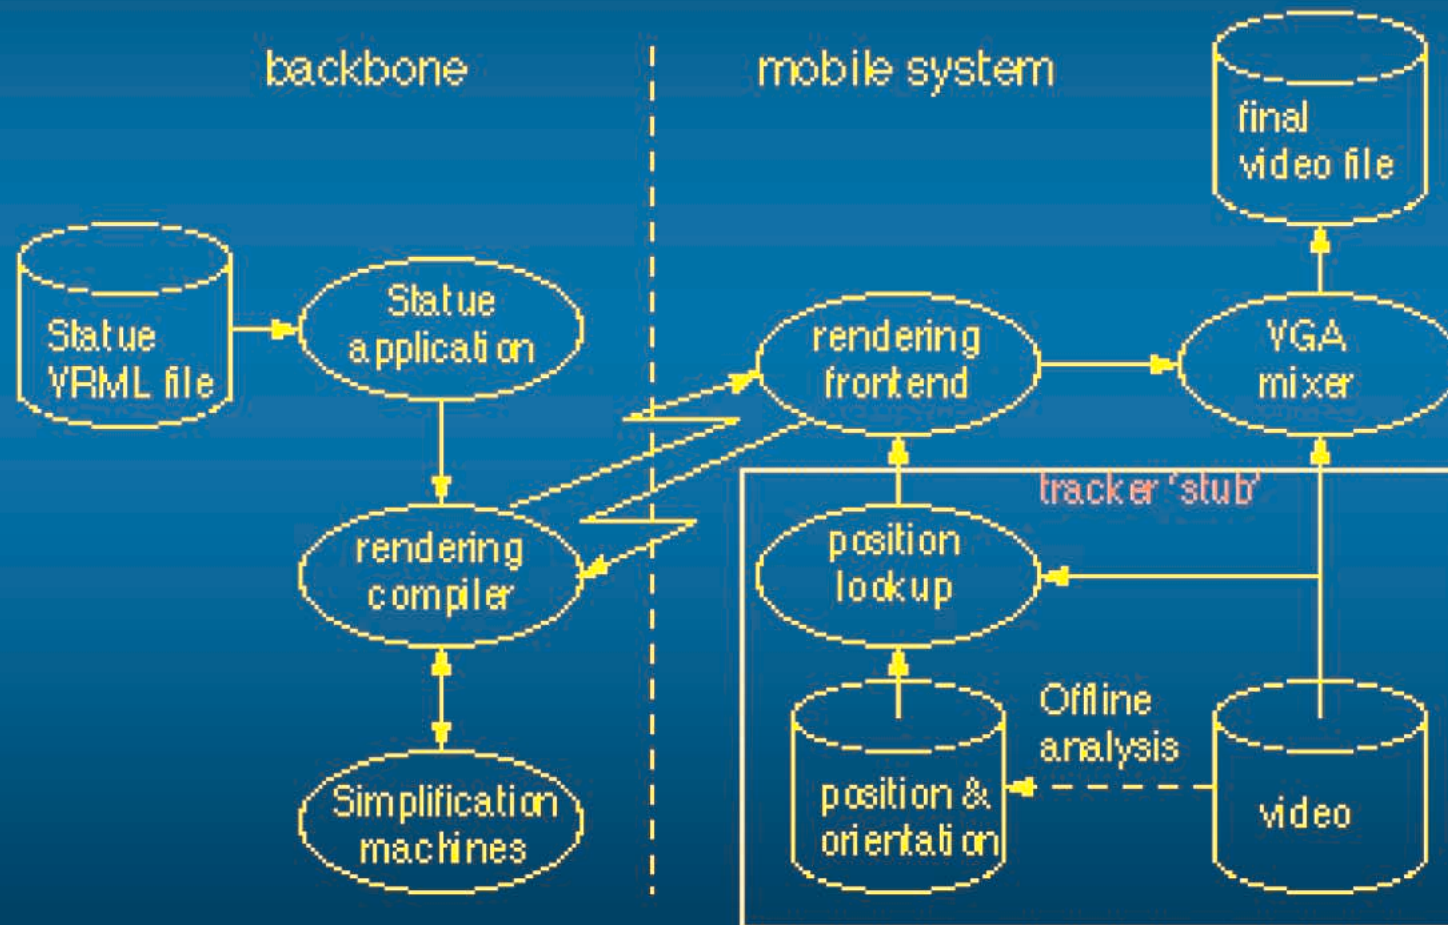

## Statue on the campus

- Prototype implementation of all previous
- Very complex, implementation was simplified at several places (caching, prediction, etc)

# Statue application

Tracker was not yet working -> tracker stub

DEMO VIDEO

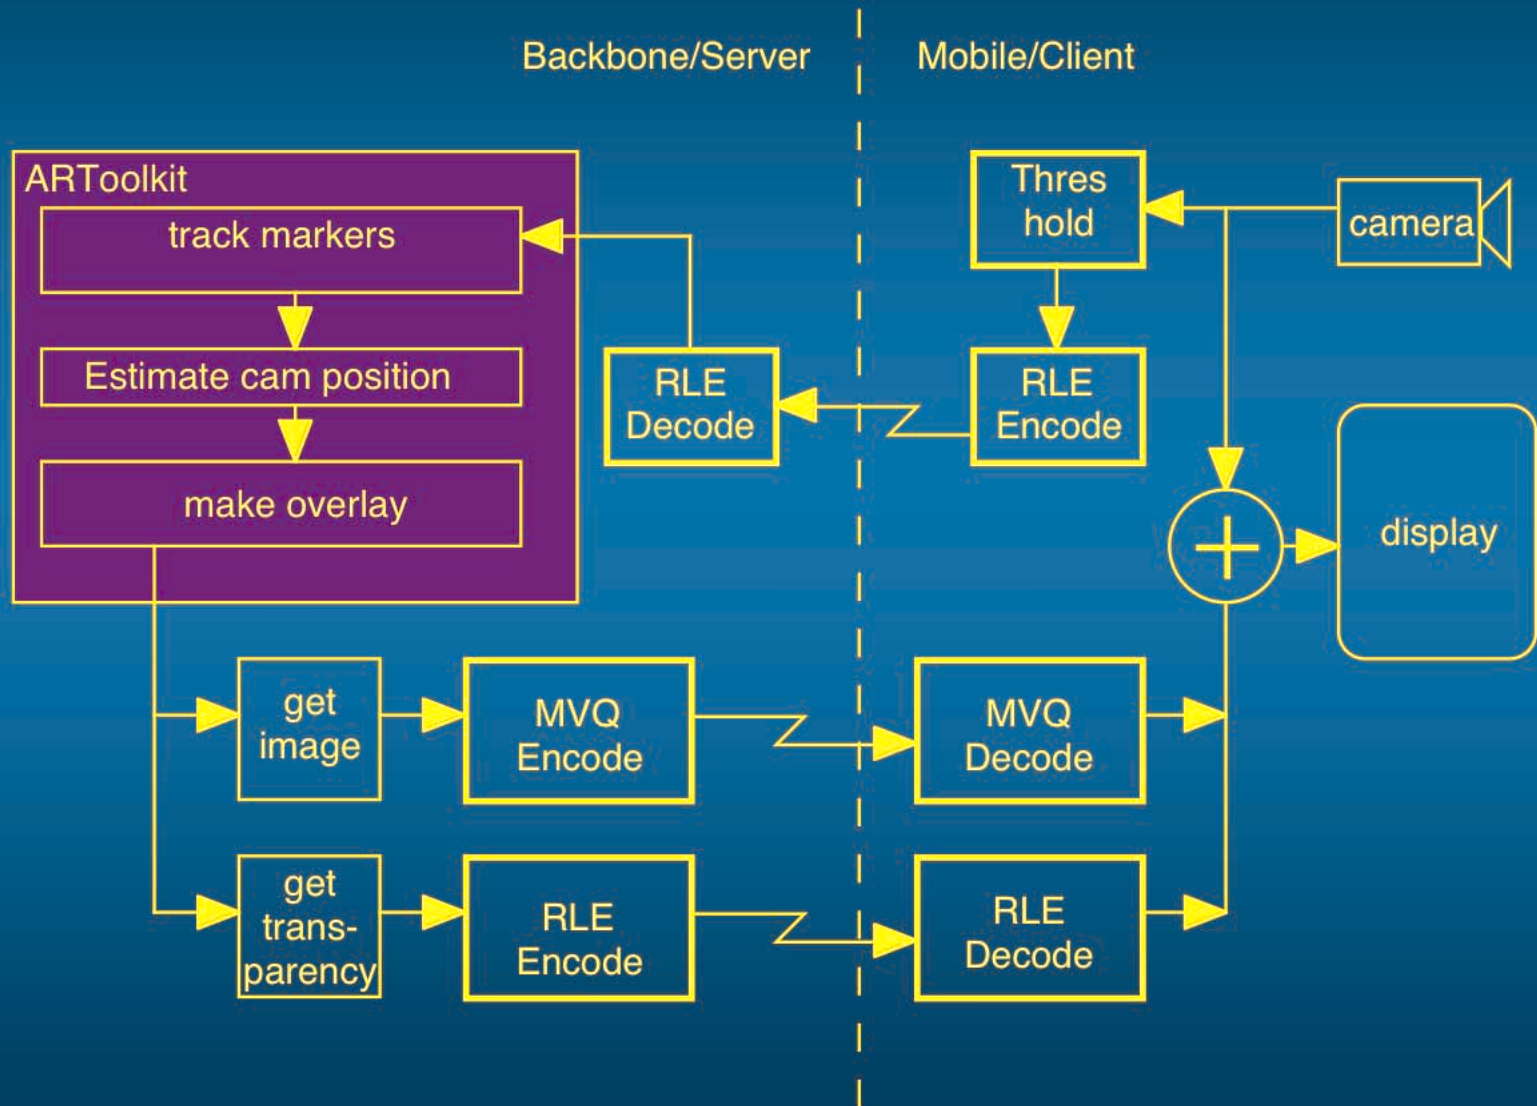

NISHE project: AR on PDA

# Implementation issues

**original**

**10dB**

**15dB**

# Speed tests

After lot of optimizations ...

800 ms per frame (WLAN)

5s per frame (GPRS)

1s per frame (USB)

# Conclusions

Current handhelds no 3D accel

Semi-realtime (eg, architecture apps)

Not good for AR using HMD

3D accelerator needed for HMD AR

Realtime simplification and LL rendering for optical mixed AR (as in UbiCom) and for very complex scenes
